To indicate approximate equality, one can use  $\approx$ ,  $\simeq$ ,  $\sim$ ,  $\cong$ , or  $\doteq$ . I need to indicate an approximate inequality. Specifically, I know A is greater than a quantity of approximately B.

The "and" is a pointer that (a) first we approximate and (b) then we compute exactly. The final result is an approximation only because of (a). Related to this, it is useful to ...

An Opening Note : First of all, I want to make this very clear that by the phrase "without using trigonometry tables", I mean without using them to find  $\sin$  values of the "non-standard ...

An approximate identity (in the sense that you've described) is a sequence of operators, usually derived from some "nice" class, that converge to the identity operator in the ...

I have been wondering for a long time whether there is a unequivocal way to define and use the symbols commonly adopted for an approximate equality between two quantities. I ...

How to approximate  $e^{-x}$  when  $x$  is large Ask Question Asked 3 years ago Modified 3 years ago

One can, for example, approximate continuous functions with polynomial functions, in which case the idea is to keep the area between the original function and the approximating function ...

In mathematical notation, what are the usage differences between the various approximately-equal signs " $\approx$ ", " $\simeq$ ", and " $\cong$ "? The Unicode standard lists all of them inside the Mathematical ...
