By coupling structural evolution and plastic deformation, the STZ theories were able to describe the effect of aging and plastic deformation on the stress response and enthalpy.

Deformation energy is calculated using the formula $E = 1/2 kx^2$, where E is the deformation energy, k is the force constant, and x is the displacement of the material.

Qualified flexible power sources should be able to endure high strain induced by external mechanical deformation, such as bending, compressing, stretching, folding, and ...
