Does Mappo reduce power consumption in 5G ultra-dense networks?

In this paper, we thoroughly study the base station control problem in 5G ultra-dense networks and propose an innovative MAPPO algorithm. The algorithm significantly reduces the overall power consumption of the system by optimizing inter-base station collaboration and interference management while guaranteeing user QoS.

Why do we need a 5G base station?

The limited penetration capability of millimeter waves necessitates the deployment of significantly more 5G base stations (the next generation Node B, gNB) than their 4G counterparts to ensure network coverage. Notably, the power consumption of a gNB is very high, up to 3-4 times of the power consumption of a 4G base stations (BSs).

How are 5G base stations selected?

However, the selection of 5G base station locations is also influenced by local terrain and population distribution, and obstacles such as streets, buildings, and trees can significantly impact signal propagation.

How effective is 5G base station optimization in urban areas?

Comparison results of 5G base station optimization in general urban areas. As shown in Table 11, the algorithm proposed in this topic reduces the site construction cost by at least 13 %, improves the coverage by at least 5.4 %, and reduces the number of base stations by at least 17.6 % compared to other algorithms.

By exploring the overlap between base station distribution and electric vehicle charging infrastructure, we demonstrate the feasibility of efficiently charging EVs using base ...

For this reason, the integrated demand response of electricity, gas, and heat is introduced into the integrated energy system, in which a 5G base station is taken into consideration for the ...

Aiming at the problem of mobile data traffic surge in 5G networks, this paper proposes an effective solution combining massive multiple-input multiple-output techniques ...

To address these issues, this article proposes a mathematical model for optimizing 5G base station coverage and introduces an innovative adaptive mutation genetic algorithm ...

The development of the 5G communication base station body market in the Middle East and Africa is influenced by several key factors.

5G is the fifth generation of cellular network technology and the successor to 4G. First deployed in 2019, [1] its technical standards are developed by the 3rd Generation Partnership Project ...

OverviewHistoryTechnologiesCore network architectureFrequency bands and coverageApplication areasPerformanceStandards

Key for connecting base stations into a network, this system ensures smooth communication. It becomes a top priority during power outages to maintain data flow.

Key for connecting base stations into a network, this system ensures smooth communication. It becomes a top priority during power ...

In this paper, a comprehensive strategy is proposed to safely incorporate gNBs and their BESSs (called "gNB systems") into the secondary frequency control procedure. Initially, ...

Various industries, including healthcare, agriculture, and manufacturing, are undergoing digital transformation. 5G plays a crucial role in enabling IoT and automation in these sectors, which ...

In data collected between July 2022 and June 2024, China was reported to have had around 3.5 million 5G base stations installed across the country, with Chinese mobile operators investing ...
