What is a 3s energy storage system?

In the world of Energy Storage, the "3S System" refers to the three core components: the Battery Management System (BMS), the Energy Management System (EMS), and the Power Conversion System (PCS). These three systems work in perfect synergy to ensure the safety, stability, and efficiency of energy storage operations.

How does a 3S system (for 3D printing) work?

The 3S system consists of a DLP (Digital Light Processing) system that projects blue light with a visual spectrum range between 450 and 475 nm and a slurry pumping system. The slurry is pumped onto the build platform for every layer during the 3D printing process. Fig. 2 (b) depicts the 3S system used for fabrication of green parts.

What is Energy Management System (EMS)?

Through real-time data collection and intelligent energy dispatching, the EMS ensures orderly, efficient system performance. In modern energy storage systems, BMS, EMS, and PCS form an inseparable trinity. The BMS safeguards the health and safety of batteries. The EMS optimizes energy usage through smart scheduling and system control.
